

evonDEX Announces Launch of Next-Generation P2P Decentralised Exchange

A new approach to decentralised trading puts traders in direct control of their assets, prices and execution

[20th August 2026] — evonDEX, a next-generation decentralised cryptocurrency exchange, today announced the soft launch of its **P2P decentralised trading** platform, opening its ecosystem to early adopters and the wider crypto community.

Built around a **peer-to-peer, on-chain order-book model**, evonDEX is designed to provide an alternative to traditional automated market maker (AMM) exchanges by allowing buyers and sellers to interact directly, without relying on conventional liquidity pools.

A mockup of the evonDEX mobile application interface. The main screen has a light blue background with the text 'Trade Directly. No Intermediaries.' in large, bold letters. Below this, a paragraph explains that evonDEX is a next-generation P2P decentralized exchange that eliminates liquidity pool risks while offering CEX-like efficiency with DEX security. There are two buttons: 'Presale EVXC' and 'App Features'. Below these are links for 'How to buy?', 'AI Price Prediction', and 'Community'. A section displays three statistics: '\$15-20T Annual DEX Volume', '0% Impermanent Loss', and '5B EVXC Total Supply'. A red button labeled 'Watch Videos' is below. At the bottom, there is a wallet address and a button for 'EVXC Contract'. On the right side, there is a panel titled 'Open with your favorite wallet' with icons for MetaMask, Trust Wallet, SafePal, and TokenPocket. Below this is a section for 'EVXC/USDT' with a price of '\$0.001'. It includes a 'Live Order Book' table with five rows of data, each showing a price, a green or red indicator, and a quantity of EVXC. A 'Start Trading' button is at the bottom of this panel.

EVXC/USDT \$0.001		
Live Order Book		
0.00102		12,500 EVXC
0.00101		8,200 EVXC
0.00100		25,000 EVXC
0.00099		15,300 EVXC
0.00098		9,800 EVXC

The soft launch marks an important milestone in evonDEX's development as the platform moves from final validation and testing toward real-world trading and community adoption.

A Different Model for Decentralised Trading

Most major decentralised exchanges have traditionally relied on AMM-based liquidity pools, where users provide liquidity to a pool and trades are executed against an algorithmic pricing curve. evonDEX takes a different approach.

Its P2P order-book architecture allows traders to place **buy and sell orders at their desired prices**, with the protocol matching counterparties directly through an on-chain trading system.

This model is designed to provide several important advantages:

1 . Direct P2P Trading

Instead of trading against a liquidity pool, users can interact directly with other market participants through an on-chain order book.

This creates a more familiar trading experience for users accustomed to traditional order-book exchanges, while retaining the core principles of decentralisation.

2. Exact-Price Execution

Traders can specify the price at which they want to buy or sell.

Rather than relying on the pricing curve of an AMM, evonDEX is designed to execute matched orders at the agreed order-book price, providing greater predictability over trade execution.

3. No AMM Impermanent Loss

Because evonDEX's P2P model does not depend on conventional liquidity pools, liquidity providers are **not exposed to the impermanent loss mechanism associated with AMM liquidity provision**.

This creates a fundamentally different opportunity for users who want to participate in decentralised markets without having to manage the risks associated with concentrated or conventional AMM liquidity positions.

4 . More Efficient Use of Trading Capital

In an order-book environment, capital can be committed at a trader's chosen price rather than being distributed across a range of prices on an AMM curve.

evonDEX is designed to allow traders and liquidity participants to deploy capital more precisely around their intended trading levels.

Non-Custodial by Design

Security and ownership remain central to the evonDEX architecture.

- **evonDEX does not take custody of users' funds.**
- **No Deposit or Withdraw.**

Users connect their compatible Web3 wallets and sign transactions directly. Assets remain under the user's control until an order is executed.

Once a compatible order is matched, smart contracts facilitate the atomic exchange of assets between the participating wallets.

This means users do not need to deposit their assets into a centralised exchange account before trading.

The result is a trading environment designed around three fundamental principles:

- **Your wallet. Your assets. Your control.**

AI-Powered Token Security

One of the platform's distinguishing features is its integrated **AI-powered anti-scam and token-risk analysis system**.

The system is designed to analyse token smart contracts and identify potentially suspicious characteristics before users trade.

Among the risk indicators that evonDEX's AI system can analyse are:

- Potential honeypot or sell-block mechanisms
- Hidden token minting capabilities
- Suspicious developer or administrator permissions
- Hidden transaction fees or token taxes
- Liquidity-lock information
- Contract ownership and renunciation status
- Other potentially suspicious smart-contract behaviours

Tokens can be assigned a **safety score from 0–100** , providing traders with an additional layer of information when evaluating unfamiliar assets.

The AI system is intended as a **risk-awareness tool rather than a guarantee of token safety**, giving users additional information to consider before making a trading decision.

Designed to Reduce MEV and Front-Running Exposure

evonDEX's direct P2P matching model is also designed to reduce certain forms of exposure associated with traditional public AMM trading.

By matching buyers and sellers directly through the order-book mechanism, evonDEX aims to reduce opportunities for certain forms of front-running and Miner/Maximal Extractable Value (MEV) activity.

For traders, this can potentially provide a more predictable trading environment, particularly when executing orders in less liquid markets.

Decentralisation Without Giving Up Trading Functionality

While decentralisation is at the heart of evonDEX, the platform is being developed with the functionality expected by modern cryptocurrency traders.

The initial platform supports **limit and market orders** , wallet connectivity and on-chain P2P order matching, with further trading and analytics capabilities planned as the ecosystem develops. ([EvonDex](#))

The broader evonDEX roadmap includes expansion into additional blockchain networks, advanced trading tools, enhanced analytics, and further AI-powered capabilities. ([EvonDex](#))

A Controlled Soft Launch

Rather than pursuing immediate mass adoption, evonDEX is taking a controlled approach to its initial public release, while rewarding early adopter users.

The soft-launch phase will allow the team to:

- Monitor real-world trading activity
- Validate order matching and execution
- Identify and resolve edge cases
- Optimise platform performance
- Gather feedback from early users
- Continue strengthening security and infrastructure
- Improve the user experience based on actual trading behaviour

This approach is intended to allow evonDEX to grow responsibly while maintaining its focus on security, stability and user experience. Early adopters will be able to participate in the incentive tiering system built into the platform

Building a New Generation of Decentralised Markets

The launch of evonDEX comes at a time when decentralised finance continues to evolve beyond the original AMM model.

AMMs played a critical role in making permissionless trading possible. However, the industry continues to explore alternative mechanisms that can improve capital efficiency, price discovery, execution and trader protection.

evonDEX believes that P2P order-book trading can form an important part of this next stage of decentralised exchange development.

By combining direct peer-to-peer matching, non-custodial architecture, on-chain execution and AI-powered token analysis, evonDEX aims to create a trading environment that brings together the strengths of decentralised finance with the precision and familiarity of an order-book exchange.

Join the evonDEX Community

The soft launch marks the beginning of evonDEX's next phase.

Early users, traders, developers, liquidity participants and blockchain enthusiasts are invited to explore the platform, provide feedback and participate in the development of the evonDEX ecosystem. **evonDEX — P2P trading. Decentralised by design.**
